

MR APPLICATION SAVE AND RESTORE SYSTEM

Abstract

A method of saving and restoring an application for an imaging system (10) includes loading a developing environment (92). An initial application, for the imaging system (10), is loaded or generated in the developing environment (92). The initial application is modified to generate an updated application. Component and link modifications between the initial application and the updated application are saved. The updated application is then stored with the modifications in a tag file. The tag file is selected and the updated application is restored according to the tag file.
